BLÜCHER®

sustainable building components

BLÜCHER® - sustainable building components

Ever since BLÜCHER started manufacturing stainless steel drainage systems in 1965, our motivation has been to create quality products with a long service life.

And today our drainage systems are produced by up to 85% recycled material.

This reflects the longevity of the stainless steel and the fact that stainless steel can be recycled without loss of properties.

Stainless steel is one of the few building components possessing the unique quality that it consists of one material only and can be recycled to the same product as the original.

BLÜCHER - from cradle to grave

Lasts longer than the building

BLÜCHER® drainage systems have a design life in excess of 50 years. This means that at the end of the lifetime of the building the BLÜCHER® products will most likely be recycled due to the strong demand for stainless steel throughout the world.

The BLÜCHER® components have no additional coatings and so are easily recycled. The demand for stainless steel is unlikely to diminish, and therefore there is an embodied financial value in using BLÜCHER® products which is released on recycling.
